Title:

Write a program to find separately the sum of the positive and negative integer elements of an array of size 10. Pass this array to a function called sortarray(int[]) and display the array elements into ascending order.

Objective:

- ❖ To understand the programming using Loop & nested loop Statements (for, while, do-while) and functions in C.

Problem Analysis:

Based on problem, it is required to define a array and four integer variable. Different operation should performed using user defined function.

| Input variables | Output variables | Necessary header files/functions/macros |
|---------------------|---------------------|---|
| a[10],j,i(int type) | Sum1,sum2(int type) | stdio.h coino.h scanf() printf() math.h display() read() sortarray() |

Algorithm:

1. Start
2. Define variables: a[]
3. Print:sortarray
4. Stop

Flowchart:

Code:

```
#include <stdio.h>
#include <stdlib.h>
void read(int a[])
{
    int i;
    for(i=0;i<10;i++)
    {
        scanf("%d",&a[i]);
    }
}

void display(int a[])
{
    int i;
```

```
for(i=0;i<10;i++)  
{  
    printf("%d ",a[i]);  
}  
}
```

```
void sortarray(int a[])  
{  
    int i,j,temp;  
    for(i=0;i<10-1;i++)  
    {  
        for(j=i+1;j<10;j++)  
        {  
            if(a[i]>a[j])  
            {  
                temp=a[i];  
                a[i]=a[j];  
                a[j]=temp;  
            }  
        }  
        printf("%d ",a[i]);  
    }  
}
```

```
int main()  
{  
    int a[10],i,j,sum1=0,sum2=0;
```

```

printf("Enter the element(integer) of array:\n");
read(a);
printf("The array is:\n");
display(a);

for(i=0;i<10;i++)
{
    if(a[i]<0)
        sum1=sum1-a[i];
    else
        sum2=sum2+a[i];
}

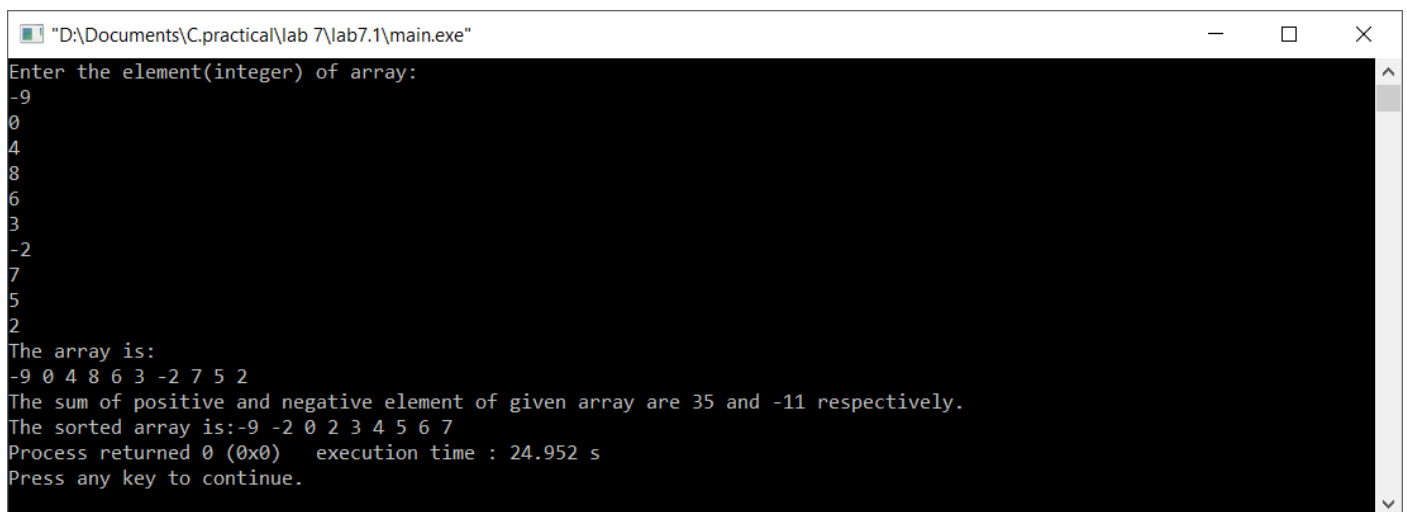

printf("\nThe sum of positive and negative element of given array are %d and -%d
respectively.\n",sum2,sum1);

printf("The sorted array is:");
sortarray(a);

return 0;
}

```

Output (Compilation, Debugging and Testing):

```

D:\Documents\C.practical\lab 7\lab7.1\main.exe
Enter the element(integer) of array:
-9
0
4
8
6
3
-2
7
5
2
The array is:
-9 0 4 8 6 3 -2 7 5 2
The sum of positive and negative element of given array are 35 and -11 respectively.
The sorted array is:-9 -2 0 2 3 4 5 6 7
Process returned 0 (0x0)   execution time : 24.952 s
Press any key to continue.

```

Discussion & Conclusion:

In this lab of C programming, based on the focused objective(s) to understand about C data types with formatted input/output functions with user defined functions.

Title:

Write a program to enter 10 floating numbers in an array and display it.

Objective:

- ❖ To understand the programming using Loop & nested loop Statements (for, while, do-while) and to be familiar with array operation in C.

Problem Analysis:

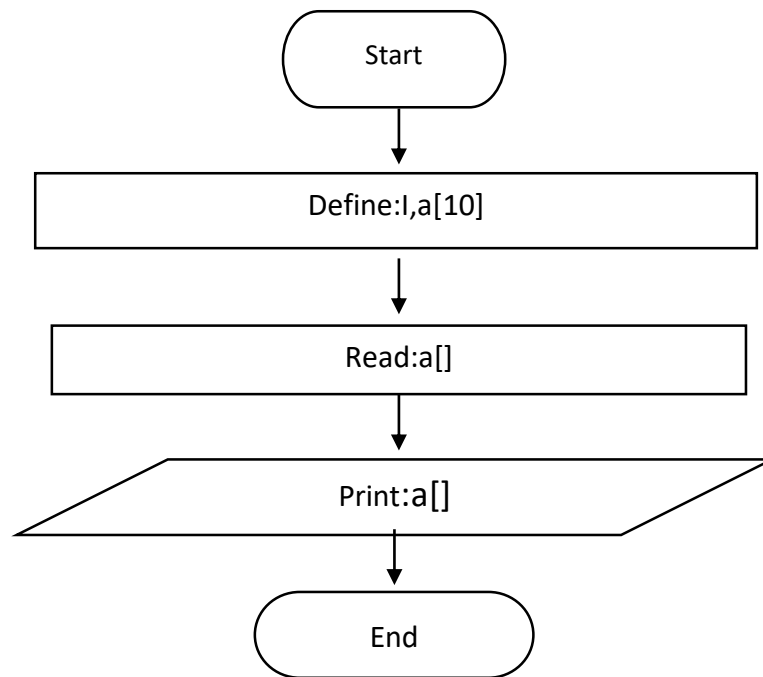

Based on problem, it is required to define one integer variable and one floating array of size 10. Different operation should performed using for loop.

| Input variables | Necessary header files/functions/macros |
|-----------------------------|---|
| i(int type) a[10](float) | stdio.h coino.h scanf() printf() |

Algorithm:

1. Start
2. Define :a[],i
3. Read:a[]
4. print: a[]
5. Stop

Flowchart:

Code:

```
#include <stdio.h>
#include <stdlib.h>
```

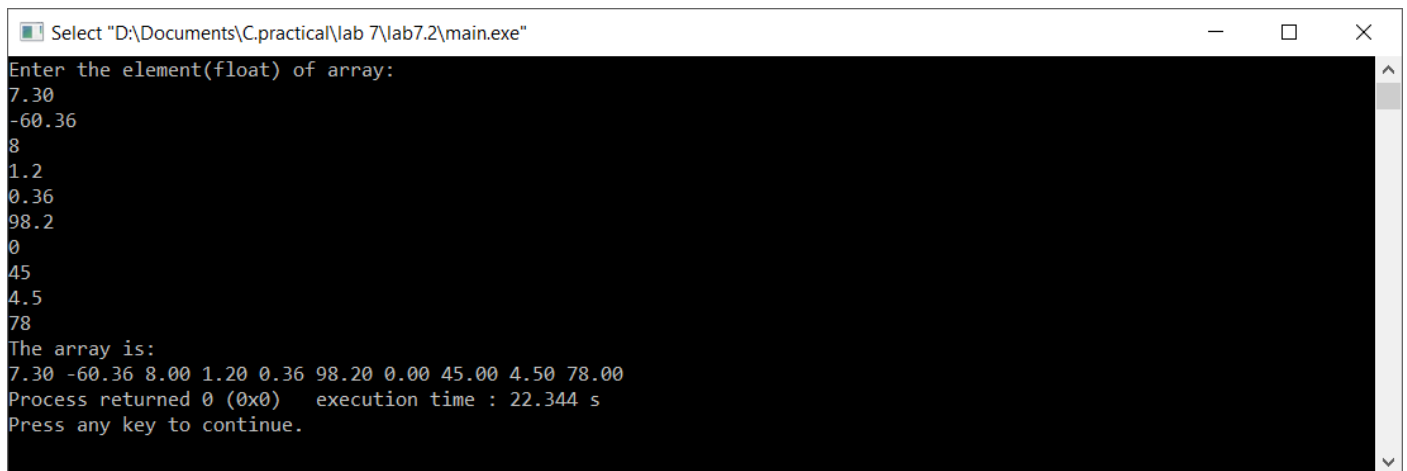

```
int main()
{
    float a[10];
    int i;

    printf("Enter the element(float) of array:\n");

    for(i=0;i<10;i++)
    {
        scanf("%f",&a[i]);
    }
```

```
printf("The array is:\n");  
for(i=0;i<10;i++)  
{  
    printf("%.2f ",a[i]);  
}  
return 0;  
}
```

Output (Compilation, Debugging and Testing):

```
Select "D:\Documents\C.practical\lab 7\lab7.2\main.exe"  
Enter the element(float) of array:  
7.30  
-60.36  
8  
1.2  
0.36  
98.2  
0  
45  
4.5  
78  
The array is:  
7.30 -60.36 8.00 1.20 0.36 98.20 0.00 45.00 4.50 78.00  
Process returned 0 (0x0) execution time : 22.344 s  
Press any key to continue.
```

Discussion & Conclusion:

In this lab of C programming, based on the focused objective(s) to understand array operations in C.

Title:

Write a program to initialize one dimensional array of size 8 and display the sum and average of array elements

Objective:

- ❖ To understand the use of functions and array operation in C.

Problem Analysis:

Based on problem, it is required to define three integer variable and two float variables. Different operation are performed using for loop.

| Input variables | Necessary header files/functions/macros |
|---|---|
| l,j,a[8](int type) Avg,sum(float type) | stdio.h coino.h scanf() printf() |

Algorithm:

1. Start
2. Define variables: avg, sum,l,j,a[8]
3. Read:a[]
4. Print:avg,sum
5. Stop

Flowchart:

Code:

```
#include <stdio.h>
#include <stdlib.h>
```

```
int main()
```

```

{
    float avg,sum=0;
    int j,i,a[8];

    printf("Enter the element(integer) of array:\n");

    for(i=0;i<8;i++)
    {
        scanf("%d",&a[i]);
    }

    printf("The array is:\n");
    for(i=0;i<8;i++)
    {
        printf("%d ",a[i]);
    }

    for(i=0;i<8;i++)
    {
        sum=sum+a[i];
    }
    avg=(float)(sum/8);

    printf("\nThe sum of element is %.1f and average is: %.2f",sum,avg);
    return 0;
}

```

Output (Compilation, Debugging and Testing):

```
"D:\Documents\C.practical\lab 7\lab7.4\main.exe"
Enter the element(integer) of array:
-9
74
63
0
-29
4
5
2
The array is:
-9 74 63 0 -29 4 5 2
The sum of element is 110.0 and average is: 13.75
Process returned 0 (0x0)   execution time : 12.448 s
Press any key to continue.
```

Discussion & Conclusion:

In this lab of C programming, based on the focused objective(s) to understand array operations in C.

Title:

Write a program to read two matrices of order 3 * 2, add them and display the resultant matrix in matrix form.

Objective:

- ❖ To understand the programming using for loop and array operations in C.

Problem Analysis:

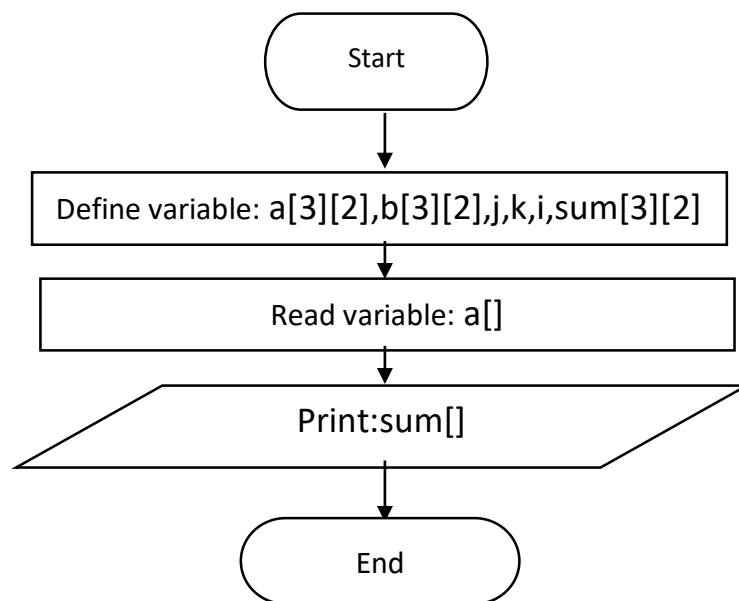

Based on problem, it is required to define five integer variable and two array of size [3][2]. Different operation should performed using if statement.

| Input variables | Necessary header files/functions/macros |
|--|---|
| a[3][2],b[3][2],j,k,i,sum[3][2] (int type) | stdio.h coino.h scanf() printf() |

Algorithm:

1. Start
2. Define variables: $a[3][2], b[3][2], j, k, i, \text{sum}[3][2]$
3. Read: $a[]$
4. Print: $\text{sum}[]$
5. Stop

Flowchart:

Code:

```
#include <stdio.h>
#include <stdlib.h>

int main()
{
    int a[3][2], b[3][2], j, k, i, sum[3][2];

    printf("Enter the first row wise matrix:\n");

    for(i=0; i<3; i++)
```

```

{
    for(j=0;j<2;j++)
    {

        scanf("%d",&a[i][j]);

    }
    printf("\n");
}

printf("Enter the second row wise matrix:\n");

for(i=0;i<3;i++)
{
    for(j=0;j<2;j++)
    {
        scanf("%d",&b[i][j]);
    }
    printf("\n");
}

printf("The sum of matrix:\n");

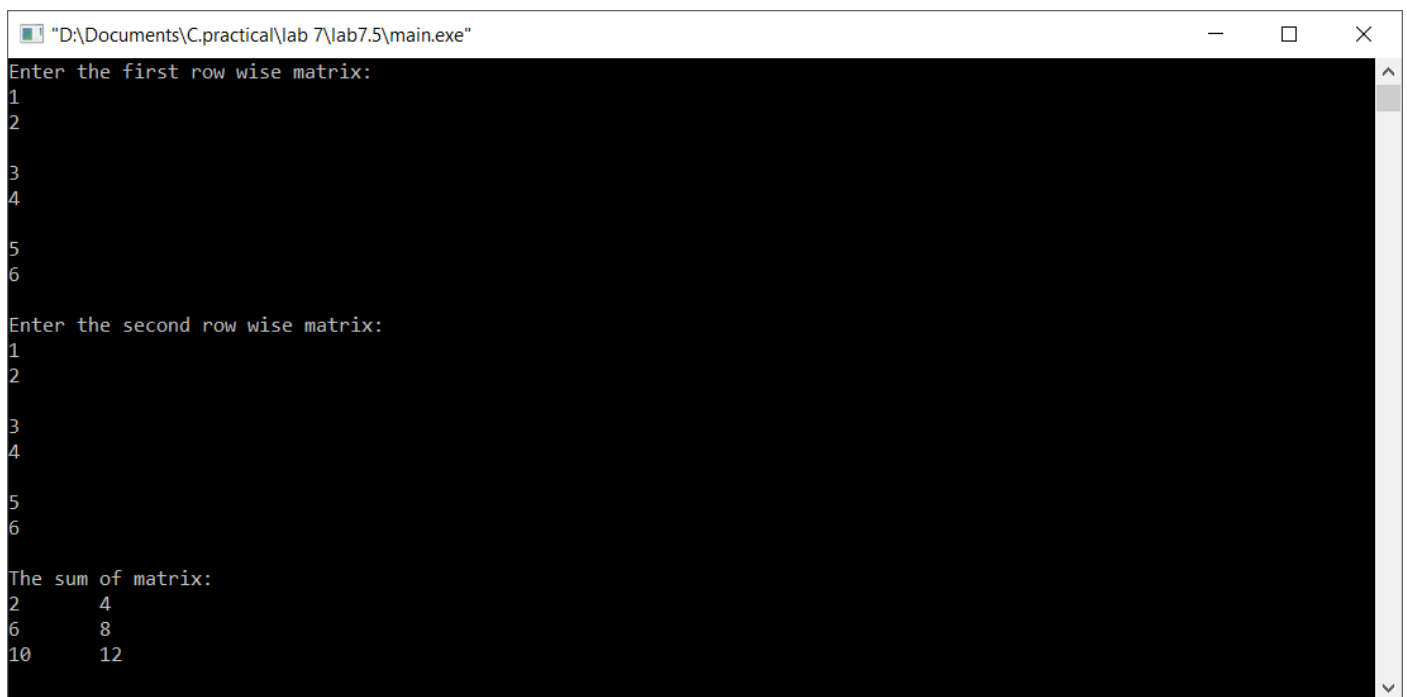

for(i=0;i<3;i++)
{
    for(j=0;j<2;j++)
    {
        printf("%d\t",a[i][j]+b[i][j]);
    }
}

```

```
printf("\n");  
}
```

```
getch();  
return 0;  
}
```

Output (Compilation, Debugging and Testing):

```
"D:\Documents\C.practical\lab 7\lab7.5\main.exe"  
Enter the first row wise matrix:  
1  
2  
3  
4  
5  
6  
Enter the second row wise matrix:  
1  
2  
3  
4  
5  
6  
The sum of matrix:  
2    4  
6    8  
10   12
```

Discussion & Conclusion:

In this lab of C programming, based on the focused objective(s) to understand use of for loop and array operation in C.

Title:

Write a program to multiply two 3*3 matrix.

Objective:

- ❖ To understand the programming using array operation, for loop and if statement in C.

Problem Analysis:

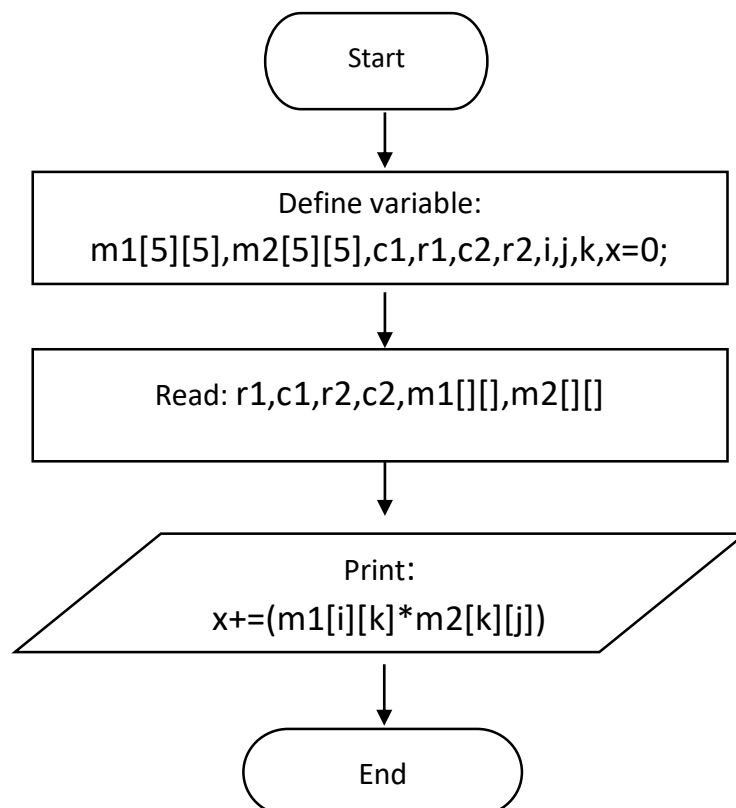

Based on problem, it is required to define two array of type integer. Different operation should performed using if statement and for loop.

| Input variables | Necessary header files/functions/macros |
|---|---|
| m1[5][5],m2[5][5],c1,r1,c2,r2,i,j,k,x=0 (int type) | stdio.h coino.h printf() |

Algorithm:

1. Start
2. Define variables: m1[5][5],m2[5][5],c1,r1,c2,r2,i,j,k,x=0
3. Read: r1,c1,r2,c2,m1[],m2[]
4. Print: x+=(m1[i][k]*m2[k][j])
5. Stop

Flowchart:

Code:

```
#include <stdio.h>

#include <stdlib.h>

int main()
{
    int m1[5][5],m2[5][5],c1,r1,c2,r2,i,j,k,x=0;

    printf("Enter the order of first matrix in the range of 5:\n");
    scanf("%d%d",&r1,&c1);

    printf("Enter the order of second matrix in the range of 5:\n");
    scanf("%d%d",&r2,&c2);

    if(c1!=r2)
    {
        printf("Multiplication is not possible!!!");
        exit(0);
    }

    printf("Enter first matrix:\n");
    for(i=0;i<r1;i++)
    {
        for(j=0;j<c1;j++)
        {
            scanf("%d",&m1[i][j]);
        }
    }
```

```
}
```

```
printf("Enter second matrix:\n");
```

```
for(i=0;i<r2;i++)
```

```
{
```

```
    for(j=0;j<c2;j++)
```

```
    {
```

```
        scanf("%d",&m2[i][j]);
```

```
    }
```

```
}
```

```
printf("The matrices are:\n");
```

```
for(i=0;i<r1;i++)
```

```
{
```

```
    for(j=0;j<c1;j++)
```

```
    {
```

```
        printf("%d\t",m1[i][j]);
```

```
    }
```

```
    printf("\n");
```

```
}
```

```
printf("&\n");
```

```
for(i=0;i<r2;i++)
```

```
{
```

```
    for(j=0;j<c2;j++)
```

```
    {
```

```
        printf("%d\t",m2[i][j]);
```

```
    }
```

```

    printf("\n");
}

printf("The product matrix is:\n");
for(i=0;i<r1;i++)
{
    for(j=0;j<c2;j++)
    {
        for(k=0;k<c1;k++)
        {

            x+=(m1[i][k]*m2[k][j]);
        }
        printf("%d\t",x);
        x=0;
    }
    printf("\n");
}
getch();
}

```

Output (Compilation, Debugging and Testing):

```
"D:\Documents\C.practical\lab 7\lab7.6\main.exe"
Enter the order of first matrix in the range of 5:
3
3
Enter the order of second matrix in the range of 5:
3
3
Enter first matrix:
1
2
3
1
2
3
5
5
2
Enter second matrix:
3
1
2
2
3
5
1
4
2
The matrices are:
1      2      3
1      2      3
5      5      2
&
3      1      2
2      3      5
1      4      2
The product matrix is:
10     19     18
10     19     18
27     28     39
Process returned 0 (0x0)   execution time : 24.703 s
Press any key to continue.
```

Discussion & Conclusion:

In this lab of C programming, based on the focused objective(s) to understand about C data types with use for loop and array operations in C.

Title:

Write a program to read a string and check for palindrome without using string related function

Objective:

- ❖ To understand use of for loop, if statement and array operation in C.

Problem Analysis:

Based on problem, it is required to define four integer and one character variables. Different array operation should perform using for loop and if statement in C.

Algorithm:

1. Start
2. Define variables: ch[],len,j,l,flag=0
3. Read:ch[]
len=strlen(ch);

for(i=0;i<(len/2);i++)
{

if(ch[i]!=ch[len-1])
{

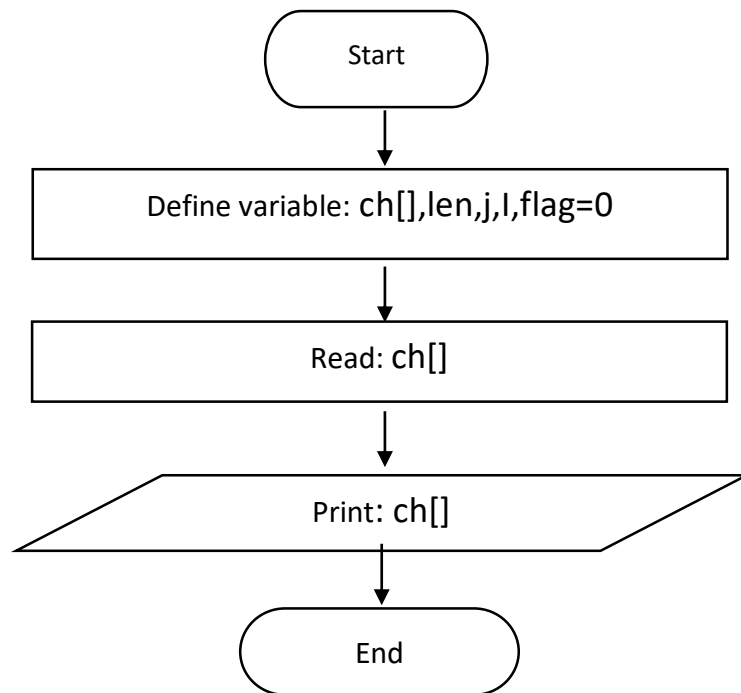

flag=1;

}
len--;

}
4. Print:
if(flag==1)
printf("\n%s is not palidrome!!!",ch);

if(flag==0)
printf("\n%s is palidrome",ch);
5. Stop

Flowchart:

Code:

```
#include <stdio.h>
#include <string.h>

int main()
{
    char ch[100];
    int len,i,j,flag=0;

    printf("Enter string:");
    gets(ch);

    len=strlen(ch);

    for(i=0;i<(len/2);i++)
    {
```

```

    if(ch[i]!=ch[len-1])
    {

        flag=1;

    }
    len--;

}

if(flag==1)
    printf("\n%s is not palidrome!!!",ch);
if(flag==0)
    printf("\n%s is palidrome",ch);
return 0;
}

```

Output (Compilation, Debugging and Testing):

```

"D:\Documents\C.practical\lab 7\lab7.7\main.exe"
Enter string:
arbinddnibra

arbinddnibra is palidrome
Process returned 0 (0x0)   execution time : 14.824 s
Press any key to continue.

```

Discussion & Conclusion:

In this lab of C programming, based on the focused objective(s) to array operation, uses of for loop and if statement in C.
